R11 total: 12

measured stars and gas of one SPARC galaxy

↓

stars → halo mass: stellar-to-halo relation — 4 knobs

↓

halo shape: Einasto, $\alpha = 0.16$, $c(M)$ from simulations

↓

feedback energy e → core exponent $n = \tanh e$ — 4 knobs

↓

core radius $r_c = \eta R_{1/2}$ — 2 knobs

↓

contraction fraction $f = f_0 + f_1 \log M_b$ — 2 knobs

↓

$g_{\mathrm{model}} = g_{\mathrm{bar}} + GM_{\mathrm{DM}}(r)/r^2$

↓

compare with the law: rms, 95th percentile, worst bin
