Where the framework stands: four views of the record (working-note figure)

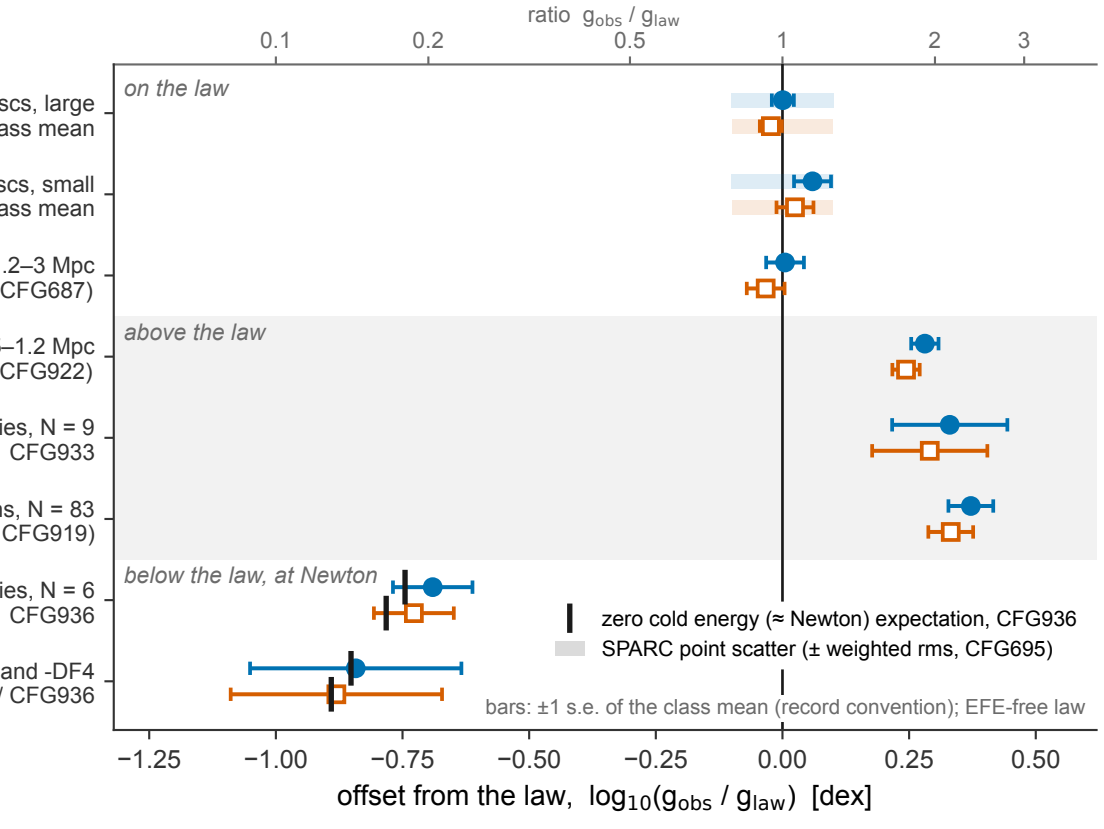

canonical $a_0 = 9.3603\times10^{-11}$ m s^{-2} — alt $a_0 = 1.1312\times10^{-10}$ m s^{-2}

filled = canonical, open = alt · two a_0 footings, never pooled · κ = ½ fitted

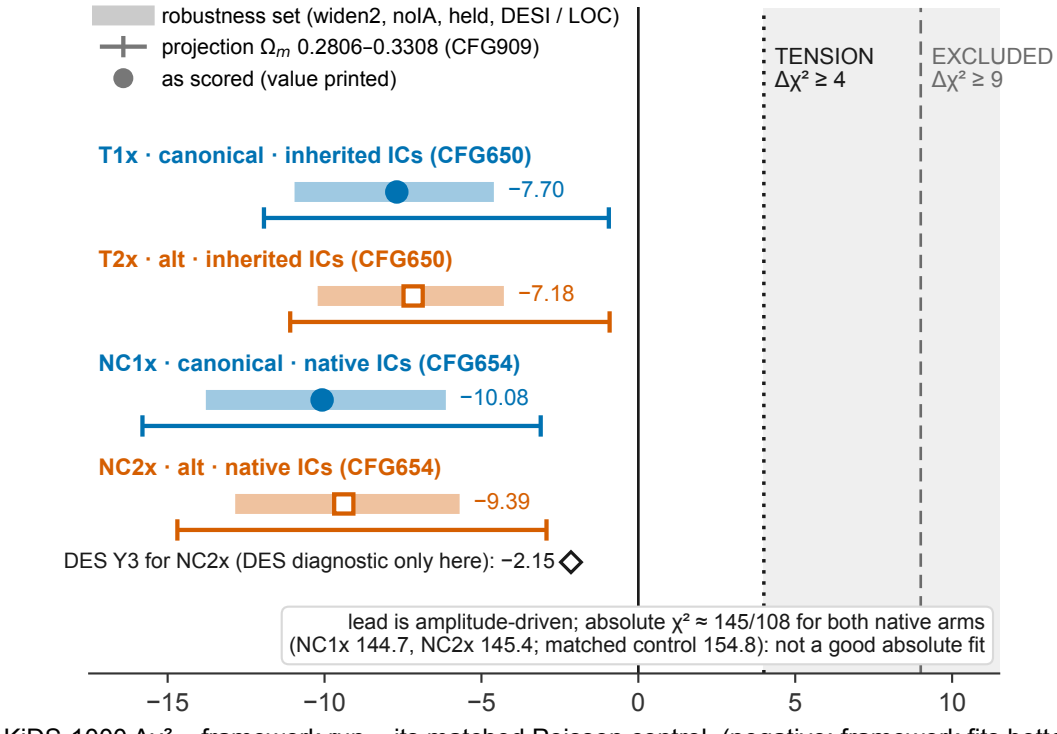

(a) Radial acceleration relation: SPARC, 175 discs

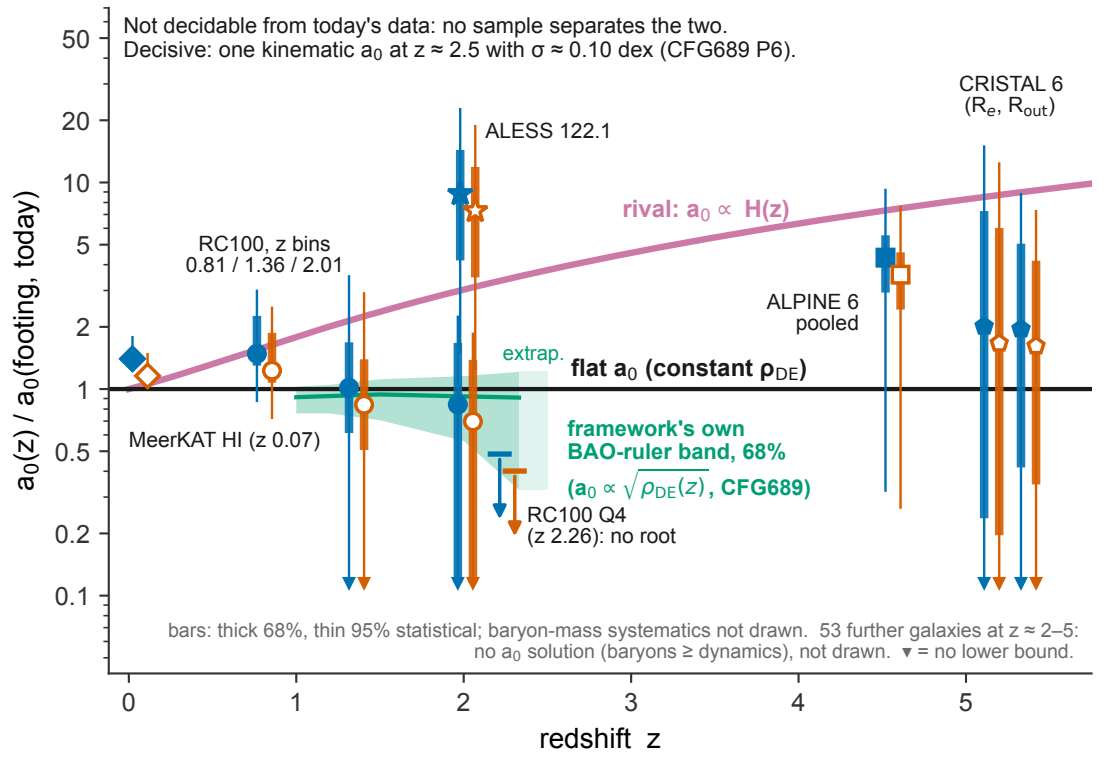

(b) The excess family: offset from the law by system class

(c) Cosmic shear, raw KiDS-1000 $\xi_\pm$: all four runs CONSISTENT

(d) a_0 across redshift: flat (framework) vs $a_0 \propto H(z)$

Working-note figure, 2026-10-21. AI-assisted research programme, not peer reviewed. κ = ½ fitted; two a0 footings never pooled; cold energy is not a particle species.
The framework is not a closed theory: the structure-formation engine has no established physical parent and the excess family is unexplained.

Data: SPARC; eRASS1 clusters × KiDS-1000 lensing; KiDS-1000 and DES Y3 cosmic shear; DESI BAO + Pantheon+ (CFG689); RC100, ALESS 122.1, ALPINE, CRISTAL, MIGHTEE-HI. Sources and checks: PROVENANCE.md, figure_audit.py.
